RE: Data Scientist role at Cognite

Dear hiring team,

At Blink SEO I built an ML platform that increased team productivity by 20x and grew into a standalone SaaS product. I deployed scalable Python systems on GCP, built Plotly dashboards, and worked in a cross-functional team where I engaged directly with stakeholders to understand their workflows. That's the kind of client-focused, production-oriented data science work I want to keep doing, which is why Cognite's approach appeals to me.

The platform I built processed 50M+ data points daily from external APIs, with async job queues in PostgreSQL and ML models (NLP clustering, embeddings) deployed to serve real users. I handled everything from data cleansing to dashboard delivery. The part I found most rewarding was iterating with the delivery team: understanding what they actually needed, deploying quickly, and watching features get adopted rather than ignored.

My PhD at the National Physical Laboratory involved extracting signals from noisy, high-dimensional time series, which is conceptually similar to deriving insights from operational industrial data. I've published in peer-reviewed journals and presented at international conferences, so I'm comfortable communicating technical work to different audiences.

I'd be glad to discuss how this experience fits with what Cognite is building.

Thank you for your consideration.

Yours sincerely,

Joshua Prettyman
