RE: AI Engineer role at Adaptify SEO

Dear hiring team,

I've spent the last three years building an AI-powered SEO platform, so when I saw Adaptify's mission to deliver SEO fully on autopilot, I had to reach out.

At Blink SEO I joined as their first data scientist when everything ran on spreadsheets. I built the entire ML platform from scratch: Python backend on GCP, BigQuery processing 50M+ data points daily, NLP-powered clustering that reduced manual keyword grouping from days to minutes, and LLM integrations via Huggingface to generate content recommendations. The platform increased team productivity by 20x and eventually became its own SaaS product, Macaroni Software. I know what it takes to build AI features that feel like magic to end users because I've done exactly that, in the SEO space specifically.

The ownership mentality you describe fits how I work. I wasn't hired to build a product, just to improve internal processes. But I saw the potential, built with scalability in mind from day one, and pushed for it to become something bigger. I'm used to rapid context switching, experimenting with new ideas, and shipping fast.

My PhD was in applied mathematics, which means I came into industry as a career changer. That transition taught me to pick things up quickly and not be precious about what I don't yet know. I'm comfortable with Python, have worked with React frontends, and have hands-on experience integrating LLMs into production systems.

I'd love to chat about what you're building and how I could contribute.

Thank you for reading.

Yours faithfully,

Joshua Prettyman
