RE: Senior ETF Data Analyst/Specialist role at ETFbook

Dear hiring team,

I've spent the last three years building a SaaS data platform from scratch, and ETFbook's mission to make ETF data accessible and actionable resonates with what I find most rewarding about this work: turning complex, messy data into something people can actually use.

At Blink SEO I built a full-stack ML platform that processed 50M+ data points daily from external APIs, with a Python backend on GCP integrated with BigQuery. I created async job queues in PostgreSQL to handle data imports and analysis tasks, built interactive dashboards in Plotly and JavaScript, and worked closely with delivery teams to translate their workflows into automated pipelines. The platform increased productivity by 20x and eventually became its own SaaS product, Macaroni Software. I've done the end-to-end delivery work you describe: acquiring data, ensuring quality and integrity, building scalable pipelines, and shipping solutions that clients trust.

I don't have direct ETF industry experience, so I'll be upfront about that. What I do bring is a quantitative foundation (PhD in Mathematics focused on time series analysis), strong Python and SQL skills, and proven ability to work with high-volume data in production systems. My research involved extracting meaningful signals from noisy, multidimensional time series data, which feels relevant to the kind of analytics work ETFbook delivers. I'm a quick learner and genuinely interested in financial markets.

I'd welcome the chance to discuss how my platform-building experience could contribute to what you're building.

Thank you for reading.

Yours faithfully,

Joshua Prettyman
