RE: Data Scientist role at VML MAP

Dear hiring team,

I've been building production ML systems in marketing tech for the last three years. At Blink SEO I created a platform that processed 50M+ data points daily through a Python backend on GCP, with PostgreSQL job queues handling async scoring and analysis. The system increased team productivity by 20x and eventually became its own SaaS product.

The similarity and clustering work I did transfers well. I built centroid matching to connect products with high-value search terms, clustering weighted by search volume, and LLM integrations for content recommendations. The domain was SEO rather than CRM, but the techniques overlap: embedding entities, scoring by weighted attributes, finding matches using similarity metrics.

Working at an agency meant collaborating with the delivery team on what to build and how. I translated their workflows into automated pipelines, built dashboards they actually used, and iterated based on feedback. The code had to work reliably for enterprise clients, so I focused on maintainable systems: version control, async processing, clean interfaces between components.

My PhD in Mathematics at the National Physical Laboratory focused on detecting patterns in noisy time series data. I published in peer-reviewed journals and presented at international conferences, so I'm comfortable explaining technical work to different audiences.

I'm based in Málaga and interested in learning more about the role.

Yours faithfully,

Joshua Prettyman
